Course plan 39th cohort
Courses

Advanced methods for fatigue design

Analysis and Optimization of Sustainable Energy Technologies in Buildings

Bibliographic resources and research tools for PHD students in Industrial Engineering

Bioelectromagnetics

Communicate Science Papers, Presentations and Posters Effectively

Coupled electrical-thermal-structural Finite Element Analyses

Deep Learning Applications in Process Engineering

Design and analysis of axial-flow industrial fans

Eco-informed Materials Choice

Ecotoxicology as an heuristic approach to environmental engineering

Electromagnetic fields and biological tissues

Entrepreneurship and Startup

Experimental measurements in thermal fluid dynamics

Finite Element Method (FEM)

Geometric Modeling of Anatomical Parts and Medical Devices

Green chemistry and technology

Heat Transfer Modelling and Numerical Applications

Introduction to Model Order Reduction

Introduction to numerical methods for unsteady gasdynamics

Life Cycle Assessment of Energy Systems: fundamentals and applications

Optimization Methods for Sustainable Energy Technologies in Buildings

Particle Image Velocimetry: theory and applications

Polymer Characterization Techniques

Powder flowability

Reactive Fluid Mechanics

Research and Entrepreunership: from scientific papers and IP to startup creation
Doctoral Program in Industrial Engineering

Course plan 39th cohort

- Smart Technologies for the sustainability of the food chain 34
- Statistics for Engineers 35
- Statistics for Engineers 36
- Stochastic methods for single- and multi-objective optimization 37
- Sustainable Energy in Buildings 38
- Technological Advancements in Electromobility 39
- Technologies for boosting energy efficiency and spreading renewable plants 40
- Tutela della proprietà intellettuale 42
- Vibration energy harvesting 43
- Yield criteria for polymer materials 44

Total number of course hours per year: 516 422 72

Total number of courses: 36
Total number of credits: 135

Ph.D. students are required to register for the courses listed above by using the Moodle platform (see https://academics.dii.unipd.it/phd/training/) and going to the page dedicated to the specific course they want to attend.

Students registered for a course who decide not to attend it, must inform the professor.

For updated information about actual dates or delivery mode, Ph.D. students are invited to exclusively refer to the Moodle page of each specific course.
Advanced methods for fatigue design

**Lecturers:**
Dr. Alberto Campagnolo, DII, University of Padova, alberto.campagnolo@unipd.it
Prof. Giovanni Meneghetti, DII, University of Padova, giovanni.meneghetti@unipd.it

**Topics:**
Introduction to fatigue assessment of mechanical components in presence of cracks or notches.
Case study: sharp V-notches under in-plane loading. Lazzarin-Tovo analytical derivation of local stress field based on complex potential functions and comparison with Williams’ solution.
Definition of Notch Stress Intensity Factors (NSIFs) and introduction to local approaches based on NSIF-concept: averaged strain energy density (SED) and peak stress method (PSM)
Practical application of local approaches to fatigue strength assessment of mechanical components by means of FE analyses (Ansys FE code).

**References:**

**Duration:** 8 hours (2 credits)

**Academic years:** 2023/24, 2024/25

**Language:** English

**Evaluation:**
Attendance is required for at least 2/3 of the lecture hours.
Final evaluation will be based on a case study.
Analysis and Optimization of Sustainable Energy Technologies in Buildings

Lecturers:
Dr. Jacopo Vivian, Urban Energy Systems Lab - Swiss Federal Laboratories for Materials Science and Technology (EMPA), jacopo.vivian@hotmail.com

Topics:
Heating and cooling of buildings accounts for up to 40% of energy use and 20% of greenhouse gas emissions. The ongoing electrification of the heating sector via electric heat pumps, the refurbishment of existing buildings to low-energy standards and the increasing penetration of renewable sources will severely affect the patterns of power supply and consumption in the electrical distribution systems. In this context, the optimal use of energy in buildings will play an important role to maximize the energy efficiency at system level without affecting the comfort of the users. This course reviews the definitions of concepts such as energy communities, plus energy districts and energy flexibility. Then, two lectures will explain different optimization methods for the optimal management of both single buildings and entire districts. During the course some examples will be provided about real applications and Matlab code will assist students in the development of their own case-study, that will be openly discussed at the end of last lecture.

References:

Duration: 16 hours (4 credits)

Academic years: 2023/24, 2024/25

Language: English

Evaluation:
Attendance is required for at least 2/3 of the lecture hours.
Final evaluation will be based on the discussion of a case study within the individual PhD project.
Bibliographic resources and research tools for PHD students in Industrial Engineering

Lecturers:
Librarians

Topics:
1st Module (4 hours)
Online course: to be attended before the face-to-face module.
- Engineering libraries and their services (local and interlibrary loan, document delivery, bibliographic reference, book purchase proposal...)
- GalileoDiscovery as the University of Padova Library Search Tool
- Engineering, Economics, Management databases (BSC, IEEE Xplore, Engineering Village, Reaxys, ACM Digital Library, ASTM Compass, DieselNET, Total Materia, BSOL, SAE Mobilus, Springer Materials)
- Citation databases: Scopus (Elsevier), Web of Science (ISI).
2nd Module (4 hours, in two lessons)
Face-to-face course
- Bibliometric indicators: quality measurements of scientific publication
- Academic publishing and Open Access. Padua Research Archive (PRA/IRIS): the institutional repository for academic research.
- Facilitations for authors, tips on authors’ rights
- Open Science and data management. Research Data Unipd, the Institutional repository for the outputs of research. (2 hours)
- Bibliographic citations and citation styles. Reference management: introduction to Zotero. (2 hours)

References:
- Engineering Central Library - University of Padova website: http://biblioingegneriacentrale.cab.unipd.it/
- The Principles of Open Scholarly Infrastructure https://openscholarlyinfrastructure.org/

Duration: 8 hours (2 credits)

Academic years: 2023/24, 2024/25, 2025/26

Language: English

Evaluation:
Attendance is necessary. Online module is required for attending the face-to-face module. The participation will be confirmed through the execution of a final test.
Bioelectromagnetics

Lecturers:
Prof. Elisabetta Sieni, Dipartimento scienze teoriche e applicate, Università dell’Insubria, elisabetta.sieni@uninsubria.it

Topics:
Introduction to bioelectromagnetics. Electromagnetic field coupled with the human body. Physical quantities involved.
Brief introduction to tissue from the point of view of electromagnetic field coupling. Electrical properties of tissue as a function of the frequency.
Protection rules from effects related to electrical and magnetic fields at low and high frequency. ICNIRP and EU regulations. Safety in working and public environments. Typical sources in industrial and public environment. Measurements of the intensity of the magnetic field at low frequency.
Effects of electric, magnetic and electromagnetic field on cells and tissues, e.g. heating and electric stimulation, considering the frequency spectrum of the electromagnetic field: from low frequency to microwaves.
Protection rules following ICNIRP rules. Electromagnetic fields in medicine

References:

Duration: 8 hours (2 credits)

Academic years: 2023/24, 2024/25

Language: English

Evaluation:
Attendance is required for at least 2/3 of the lecture hours. Final evaluation will be based on a written questionnaire.
Communicate Science Papers, Presentations and Posters Effectively

Lecturers:
Gregory S. Patience, Polytechnique Montréal, gregory-s.patience@polymtl.ca

Topics:
This workshop demonstrates writing practices to communicate ideas efficiently and proposes guidelines to activate text. By the end of this workshop, the attendees will be able to:
- recognize the importance of expressing ideas.
- identify the origin of convoluted language and correct it.
- reformulate passive sentences to the active voice.
- apply logos, pathos, and ethos to present data and ideas.
- remove metadiscourse (hedging, boosting, redundant, and narcissism) appropriately.
- write meaningful abstracts, highlights, and graphical abstracts. and,
- report data according to the SI convention - significant figures and units.

Duration: 16 hours (4 credits)

Academic years: 2023/24

Language: English

Evaluation:
Attendance is required for at least 2/3 of the lecture hours. Final evaluation will be based on a final exam.
Coupled electrical-thermal-structural Finite Element Analyses

Lecturers:
Prof. Giovanni Meneghetti, DII, University of Padova, giovanni.meneghetti@unipd.it
Eng. Mattia Manzolaro, Laboratori Nazionali di Legnaro, Istituto Nazionale di Fisica Nucleare, mattia.manzolaro@lnl.infn.it

Topics:
Course overview and introduction. General aspects of Finite Element analyses related to the structural, thermal and electrical fields. Structural analyses with plane and solid elements. Thermal analyses with plane and solid elements, implementing thermal conduction, thermal convection and thermal radiation. Coupled field thermal-structural analyses. Coupled field electrical-thermal analyses. Coupled field electrical-thermal-structural analyses. Presentation of a complex test case implementing all the aforementioned physical fields with a specific focus on complex geometry import.

G. Meneghetti, M. Manzolaro, M. Quaresimin, INTRODUCTION TO THE STRUCTURAL ANALYSIS WITH ANSYS® NUMERICAL CODE, edizioni LIBRERIA PROGETTO, 2014, Padova, ITALY.

Duration: 12 hours (3 credits)

Academic years: 2023/24, 2024/25

Language: English

Evaluation:
Attendance is required for at least 2/3 of the lecture hours.
Final evaluation will be based on a case study developed during the lectures.
Deep Learning Applications in Process Engineering

Lecturers:
Prof. Dr. Leonhard Urbas, Technical University of Dresden, leon.urbas@tu-dresden.de

Topics:
The Deep Learning (DL) branch of Artificial Intelligence saw breakthroughs in the last 30 years due to the availability of (almost) free data, huge compute power and algorithmic innovations. In this course we learn about the idea, the math, the architectures, and the potentials and pitfalls of selected DL methods for chemical engineering applications by investigating exemplary applications. During the course we will study python code that will assist students in the development of their own case-study, that will be openly discussed at the end of last lecture. The lectures will cover the following topics:
- Introduction to the data science life cycle
- Refresher of the basic statics background (conditional probability, joint probability, class-conditional distribution)
- Supervised Deep Learning with CNN for classification tasks (bubble distribution classification in a steered zank) and RNN/LSTM for time series analysis (algae growth prediction)
- Generative Deep Learning with GAN (process fault diagnosis) and Variational Auto Encoders (reconstruct missing variables)
- Final overview on optimization methods and short presentations about cases of study

References:

Duration: 16 hours (4 credits)

Academic years: 2023/24

Language: English

Evaluation:
Attendance is required for at least 2/3 of the lecture hours. Final evaluation will be based on the case study presentation.
Design and analysis of axial-flow industrial fans

Lecturers:
Prof. Massimo Masi, Department of Management and Engineering - DTG, University of Padova, massimo.masi@unipd.it

Topics:
Fundamentals of axial-flow industrial fans: applications of industrial axial-flow fans. axial-flow fan operating principle. aerodynamic performance parameters. fan internal flow approximations (from 1D to 3D). radial equilibrium model and blade aerodynamic loading. axial-flow fan aerofoil sections. cascade versus isolated aerofoil aerodynamics.

Preliminary design: similarity principles applied to axial-flow fans. selection of the fan configuration best suited to a specific performance requirement. definition of the size and rotational speed of the rotor. definition of the meridional geometry. definition of the velocity diagrams corresponding to the selected blade loading distribution.

Aerodynamic design of axial-fan bladings: aerofoil performance charts. definition of the blade geometry. stall margin. effects of the Reynolds number. secondary flows and tip clearance effects.

Computational fluid-dynamics applied to axial-flow fan analysis: computational domains best suited to support the different phases of fan design. physical models, numerical schemes and solution algorithms. use of CFD tools for fan aerodynamics (pre-processing tasks, running the simulation, post-processing the results).

Experimental fluid dynamics applied to axial-flow fan analysis: basics of fan testing. standard test rig installation types. experimental assessment of the global aerodynamic performance of an axial-flow fan. local flow field measurement techniques suited to support the fan design.

References:

Duration: 24 hours (6 credits)

Academic years: 2023/24

Language: English
Evaluation:
Attendance is required for at least 2/3 of the lecture hours.
Final evaluation will be based on: discussion of the written report on the aerodynamic design and CFD analysis of an axial-fan able to fulfil the performance requirements assigned to each student during the course lessons.
Eco-informed Materials Choice

Lecturers:
Enrico Bernardo

Topics:
Introduction to materials selection. Material property charts.
The materials life cycle.
Eco-data: values, sources, precision
Eco-audits and eco-audit tools. Case studies.
Strategies for eco-informed materials selection

References:
M.F. Ashby, Materials and the Environment, Butterworth Heinemann, Oxford, UK
M.F. Ashby, Materials Selection in Mechanical Design, Butterworth Heinemann, Oxford, UK

Duration: 12 hours (3 credits)

Academic years: 2023/24, 2024/25

Language: English

Evaluation:
Attendance is required for at least 2/3 of the lecture hours. Final evaluation will be based on a written questionnaire
Ecotoxicology as an heuristic approach to environmental engineering

Lecturers:
Luca Palmeri, DII, University of Padova, Lpalmeri@unipd.it

Topics:
Introduction (1)
Introduction (2)
Regulations
Chemical classifications
Chemical classifications (II)
Chemical properties - chemicals (I)
Chemical properties - chemicals (II)
«Chemical properties - partition coefficient and degradation parameters (III)
Exercise on partition coefficient»
«Chemical properties - ecotoxicological parameters (IV)
Exercise. Ecological risk assessment»
«Exercise on chemical properties estimation
QSAR approach + Exercise»
«Environmental chemical profile - Chemical of the year
Fugacity model - assumptions»
«Toxicity testing
Dose response and time-response (I)»
«Toxicity testing
Dose response and time-response (II)»
Fugacity model + exercises (I)
Fugacity model + exercises (II)
Lab experience
Fugacity model + exercises (III)
AQUATOX APPLICATION for the RISK ASSESSMENT - case study (I)
AQUATOX APPLICATION for the RISK ASSESSMENT - case study (II)
Lab experience Lepidium sativum

References:
Ecotoxicology and Environmental Safety

Duration: 12 hours (3 credits)

Academic years: 2023/24, 2024/25

Language: English

Evaluation:
Attendance is required for at least 2/3 of the lecture hours.
Electromagnetic fields and biological tissues

Lecturers:
Prof. Elisabetta Sieni, Dipartimento di Scienze Teoriche e Applicate, Università dell’Insubria, elisabetta.sieni@uninsubria.it

Topics:
Introduction to electromagnetic field coupled with the human body.
Brief introduction on cell membrane and cell biology and electrical properties of tissues as a function of the frequency. Measurements of biological tissue electrical properties. Electric field distribution in inhomogeneous tissues.
Mechanism of electric stimulation. Muscle contraction. Tissue heating. Induced current and induced electric field.
Mechanisms involved in the interaction of cells/tissues with electric and magnetic field. The electric model of the cell. Coupling the tissue with electric and magnetic fields.
Medical uses of electromagnetic fields (e.g. electrochemotherapy, ECT, and magneto fluid Hyperthermia, MFH).

References:
Research papers and book chapters will be provided during the course.

Duration: 8 hours (2 credits)

Academic years: 2023/24, 2024/25

Language: English

Evaluation:
Attendance is required for at least 2/3 of the lecture hours. Final evaluation will be based on a multiple choice questionnaire.
Entrepreneurship and Startup

Lecturers:
Prof. Moreno Muffatto, DII, University of Padova, moreno.muffatto@unipd.it
Ing. Francesco Ferrati, DII, University of Padova, francesco.ferrati@unipd.it

Topics:
Entrepreneurship
Technology based startup vs SMEs
Venture creation: different options
The team and the early decisions
Types and characteristics of founders’ teams
Founders’ decisions and their consequences
From the idea to the market
Innovation: technologies and markets
Market size
Development of the product/service concept
Intellectual Property Rights
The structure of a patent application (description, claims, etc)
Getting a patent: the patenting process (step by step)
Business Models
Business models case studies
Revenue streams
The financials of a startup
The structures of the financial statements
Evaluation of the value of the company
Funding a startup
New ventures’ funding options
How and what investors evaluate
How to present a business idea to investors

References:

Duration: 20 hours (5 credits)

Academic years: 2023/24, 2024/25

Language: English

Evaluation:
Attendance is required for at least 70% of the lecture hours (i.e. 14 hours).
Final evaluation will be based on the discussion of a case study of a technology-based startup.
Experimental measurements in thermal fluid dynamics

Lecturers:
Prof. Stefano Bortolin, DII, University of Padova, stefano.bortolin@unipd.it
Dr. Arianna Berto, DII, University of Padova, arianna.berto@unipd.it

Topics:
Measurements of pressure, temperature and flow rate.
Thermocouples: theory and experimental calibration
Uncertainty in measurements: theory and practice
Experimental temperature and flow rate measurements during two-phase flow
Introduction to the experimental measurement of the heat transfer coefficient
Measurements of solar radiation and concentrated solar flux
Infrared thermography

References:
Termodinamica applicata, A. Cavallini, L. Mattarolo, CLEUP Editore, cap. XIII.

Duration: 14 hours (3.5 credits)

Academic years: 2023/24

Language: English

Evaluation:
Attendance is required for at least 2/3 of the lecture hours.
Final evaluation will be based on a home assignment.
Finite Element Method (FEM)

**Lecturers:**
Prof. Giuseppe Gambolati, Dipartimento di Ingegneria Civile Edile e Ambientale (DICEA), University of Padova, gambo@dmsa.unipd.it

**Topics:**

**References:**
Handouts from the lectures.

**Duration:** 32 hours (8 credits)

**Academic years:** 2023/24, 2024/25

**Language:** English

**Evaluation:**
Attendance is required for at least 2/3 of the lecture hours. Final evaluation will be based on an oral examination.
Geometric Modeling of Anatomical Parts and Medical Devices

Lecturers:
Prof. Francesca Uccheddu, DII, University of Padova, francesca.uccheddu@unipd.it

Topics:
Course overview and introduction
Basics of Reverse Engineering
External/Internal anatomic parts acquisition methods
Free-form/Surface modeling design of anatomical replicas
CAD modeling design of medical devices
Clinical cases description

References:

Duration: 8 hours (2 credits)

Academic years: 2023/24, 2024/25

Language: English

Evaluation:
Attendance is required for at least 2/3 of the lecture hours. Final evaluation will be based on a clinical case study developed during the lectures.
**Green chemistry and technology**

**Lecturers:**
Prof. Roberta Bertani, DII, University of Padova, roberta.bertani@unipd.it
Prof. Paolo Sgarbossa, DII, University of Padova, paolo.sgarbossa@unipd.it
Other experts in the fields of green chemistry and engineering for topic lessons (defined each year)

**Topics:**
The aim of the course is to cover the various aspects of green or sustainable chemistry, a new way of looking at and designing industrial chemical processes. Different aspects will be considered, such as:
- basis of green chemistry and green engineering,
- green solvents,
- green synthesis,
- green catalysis,
- green nanotechnology,
- green metrics,
- aspects of REACH legislation.
The lessons will be accompanied by examples of application and case studies which will contribute to the understanding of the approach to the conversion of traditional processes to green or greener ones.

**References:**
Anastas P.T. and Lapkin A. (editors), Green Chemical Engineering, 2018, Ed. Wiley
Other updated references will be provided to the enrolled students.

**Duration:** 12 hours (3 credits)

**Academic years:** 2023/24, 2024/25

**Language:** English

**Evaluation:**
Attendance is required for at least 2/3 of the lecture hours.
Final evaluation will be based on a short essay written on a specific aspect or process among those treated during the course and its discussion.
Heat Transfer Modelling and Numerical Applications

Lecturers:
Prof. Angelo Zarrella, DII, University of Padova, angelo.zarrella@unipd.it

Topics:
The course looks at an introduction to the principal concepts and methods of heat transfer, both analytical and numerical solutions, oriented especially to buildings and their plant systems. The objectives of the course are to develop modelling skills of heat transfer, corresponding numerical implementation and solving in order to explore the implications for the thermal behavior (in steady and transient state) of the system/case study. During the course the implementation and programming of some common thermal problems in real-world applications are presented. PhD Students will have the opportunity to see these examples and take familiarity and ability to work on heat transfer. These outcomes will be demonstrated through an assignment that will be discussed at the end of the course.

References:
ASHRAE Fundamentals.

Duration: 12 hours (3 credits)

Academic years: 2023/24, 2024/25

Language: English

Evaluation:
Attendance is required for at least 2/3 of the lecture hours.
Final evaluation will be based on the discussion of a case study within the individual PhD project.
Introduction to Model Order Reduction

Lecturers:
Ing. Riccardo Torchio, DII, University of Padova

Topics:
Model order reduction (MOR) is a technique for reducing the computational complexity of mathematical models in numerical simulations. As such it is closely related to the concept of metamodeling, with applications in all areas of mathematical modelling. In this short course, the main numerical approaches to perform MOR will be presented. In particular, the Proper Orthogonal Decomposition (POD) will be discussed and a basic implementation of the algorithm will be presented. This basic POD algorithm will be then applied to speed up time domain simulations of a thermal problem in MATLAB.

References:

Duration: 8 hours (2 credits)

Academic years: 2023/24

Language: English

Evaluation:
Attendance is required for all the lecture hours. Final evaluation will be based on the code implemented during the course.
Introduction to numerical methods for unsteady gasdynamics

Lecturers:
Francesco De Vanna, DII, University of Padova, francesco.devanna@unipd.it

Topics:
Gasdynamics is the branch of fluid dynamics that studies the motion of gaseous systems. It is a tradition of introductory gas dynamics courses to detail the main effects of the motion of a compressible flow such as shock waves, nozzle and diffuser internal fluid dynamics and aerodynamics of airfoils affected by high Mach number conditions. It is always a tradition of introductory courses to develop such concepts in a steady-state path, that is, for flowing systems in which the temporal variability can be neglected. Usually this approximation may be sufficient at an applicative level. However, if the investigation of more complex phenomena such as turbulent wakes, interactions between shock waves and boundary layer, multiple interactions between shock waves is of interest, temporal dependency plays a primary role. The present course addresses the basics concerning the theory of the hyperbolic system of equations providing the minimal aspect of non-stationary phenomena inherent to compressible fluids.
1) Introduction to hyperbolic system of equations: the Euler equations of gasdynamics.
2) Theory of characteristics and its applications to conservative systems.
3) Introduction the Riemann problems. Jump relations and dynamical shock wave and expansion fans.
4) Application to a time-dependent gasdynamics problem: the shock tube.
The course will provide some basic notions of compiled programming languages with a focus on modern Fortran90 for high-performance computing.

References:

Duration: 8 hours (2 credits)

Academic years: 2023/24, 2024/25

Language: Italian

Evaluation:
Attendance is required for at least 2/3 of the lecture hours while final evaluation is based on an oral discussion about the course contents.
Life Cycle Assessment of Energy Systems: fundamentals and applications

Lecturers:
Prof. Alberto Benato, DII, University of Padova, alberto.benato@unipd.it
Prof.ssa Anna Stoppato, DII, University of Padova, anna.stoppato@unipd.it

Topics:
Life Cycle Assessment (LCA) is today one of the most accredited assessment methods at the international level for the quantification of the environmental impact of a product or a process. It assesses, in a systematic way, the environmental aspects and potential environmental impacts throughout a product’s life cycle from raw material acquisition through production, use, end-of-life treatment, recycling and final disposal. The National Risk Management Research Laboratory of the United States Environmental Protection Agency, stated that «LCA is a technique to assess the environmental aspects and potential impacts associated with a product, process, or service, by:
- Compiling an inventory of relevant energy and material inputs and environmental releases.
- Evaluating the potential environmental impacts associated with identified inputs and releases.
- Interpreting the results to help you make a more informed decision.»
Therefore, LCA is a technique to assess environmental impacts associated with all the stages of a product’s life from raw material extraction through materials processing, manufacture, distribution, use, repair and maintenance, and disposal or recycling. In practice, the associated environmental impacts are evaluated with a cradle-to-grave or cradle-to-cradle approach. This investigation technique guarantees to go beyond the geographical boundaries of the production process and to assess the impacts throughout the «value chain», such as those associated with emissions due to the entire energy and materials supply chain as well as construction, operation and decommissioning phases of plants.
Then, LCA information can be used to improve processes, support policy, and provide a sound basis for informed decisions.
During the Ph.D. course lessons, the four stages of the LCA will be presented following the specifications stated on the standards ISO 14040 and 14044:
- Goal and scope.
- Inventory analysis.
- Impact assessment.
- Interpretation.
The most used and complete models and methods for the impact assessment and updated databases for the Inventory analysis will be presented. The use of LCA for the environmental labels system will be analyzed.
The course focuses on the assessment of energy systems and the energetic aspects. for this reason, the proper evaluation of the reference system for the electricity and heat production will be deepened.
Several examples of LCA will be presented with the aim of understanding the importance of:
- The functional unit.
- The system boundaries.
- Any assumptions and limitations.
- Data quality requirements.
- The allocation methods.
- The impact categories.
- Etc..
Finally, the code SimaPro, a professional tool to collect, analyze and monitor the sustainability performance
data of products, services, etc., will be presented and used to conduct a Life Cycle Analysis of a Renewable Plant.

**Evaluation:**
Attendance is required for at least 2/3 of the lecture hours while final evaluation is based on an oral examination.
Optimization Methods for Sustainable Energy Technologies in Buildings

Lecturers:
Dr. Jacopo Vivian, DII, University of Padova, jacopo.vivian@unipd.it

Topics:
Heating and cooling of buildings accounts for up to 40% of energy use and 20% of greenhouse gas emissions. The ongoing electrification of the heating sector via electric heat pumps, the refurbishment of existing buildings to low-energy standards and the increasing penetration of renewable sources will severely affect the patterns of power supply and consumption in the electrical distribution systems. In this context, the optimal use of energy in buildings will play an important role to maximize the energy efficiency at system level without affecting the comfort of the users. This course will focus on different optimization methods that can be used both for design and operation of energy systems with a particular focus on the integration of renewable energy in the building sector. During the course some examples will be provided about real applications and Matlab code will assist students in the development of their own case-study, that will be openly discussed at the end of last lecture. The lectures will cover the following topics:

- Introduction to optimization: definition and concepts, optimality criteria for constrained and unconstrained problems, methods for nonlinear problems, examples using steepest descent, fminunc, fmincon.
- Optimization applied to energy systems: design, operation and synthesis, the process of problem formulation, a design optimization example.
- Linear programming and mixed integer linear programming (MILP): A design optimization example using MILP, a control optimization example using MILP, examples of Model Predictive Control applied to buildings with PV systems.
- Mixed integer quadratically-constrained programming (MIQCP) to optimize the design and operation of a district heating and cooling network with seasonal thermal energy storage systems.
- Some concepts about optimization in buildings: energy flexibility sources, demand response and other services, presentation of a BEMS based on different optimization methods.
- Final overview on optimization methods and short presentations about cases of study.

Evaluation:
Attendance is required for at least 2/3 of the lecture hours. Final evaluation will be based on the case study presentation.
Particle Image Velocimetry: theory and applications

Lecturers:
Ing. Antonio Rossetti, Consiglio Nazionale delle Ricerche - Istituto per le Tecnologie della Costruzione, Sede di Padova, antonio.rossetti@itc.cnr.it

Topics:
PIV is an optical, mild intrusive measuring technique largely applied in many engineering fields to study and optimize fluid dynamic problems. Once a highly expensive tool, in the last years it has become a more accessible and diffuse technology in research facilities and industries thanks to the reduction of the costs of digital sensors (SCMOS) and laser sources.
The course will focus on the theoretical and practical aspects of the Particle Image Velocimetry including the theoretical background (such as geometrical and physical optics), the component selection criteria to optimize an experiment set-up and the post processing algorithms.
Application examples to real cases will be discussed, highlighting the actual peculiarities of setting up a PIV experiment for a given problem.
While the course will mainly focus on basics Set-Up as the 2D Mono and Stereo PIV, advanced techniques such as the Dual Pane, the Tomo-PIV and particle tracing techniques will be also introduced at the end of the course.
The course will end with and experimental activity that will involve the students in the main steps of a PIV experimental champaign such as: the cameras set-up, the calibration procedure, the acquisition and the application of pre and post-processing filter to the recordings.
The course lesson will be held at the ITC - CNR thermo-fluid dynamic laboratory at the «Area territoriale di Ricerca di Padova» - Corso Stati Uniti,4 - 35127 Padova - Italy«

Evaluation:
Attendance is required for at least 2/3 of the lecture hours.
Final evaluation will be based on an oral test.
Polymer Characterization Techniques

Lecturers:
Dr. Sajid Hussain, DII, University of Padova, sajid.hussain@unipd.it

Topics:
The course provides a theoretical background and a practical approach to the main characterization techniques of polymeric materials for their identification and analysis.

• Thermal analysis:
  - differential scanning calorimetry (DSC) and modulated differential scanning calorimetry (M-DSC)
  - thermo-gravimetric analysis (TGA)
  - dynamic-mechanical analysis (DMA)
  - oxidation induction time (OIT).
• Viscosimetry and molecular weight:
  - melt flow index (MFI)
  - capillary viscometer
  - rotational viscometer
  - size exclusion chromatography (GPC)
• Infrared and Raman spectroscopy
• Mechanical characterization:
  - specimen preparation
  - tensile testing
  - flexural testing
  - compression testing
  - impact resistance
The lessons will be accompanied by practical examples of the application of the different techniques (sample preparation, analysis setting, results interpretation)

Final evaluation will be based on a written questionnaire.
Powder flowability

Lecturers:
Prof. Andrea Santomaso, DII, University of Padova, andrea.santomaso@unipd.it

Topics:
The course presents the basic knowledge and fundamental concepts that are needed by engineers dealing with problems related to powder flowability.
Relevant properties and characterization of particulate materials (particle shape, size, apparent density, surface area, porosity).
Types of interactions between particles (solid-solid contact) and definition of cohesion. Definition and assessment of powder flowability.
Static and dynamic analysis of stresses in solids (solid mechanics).
Yielding criteria in powders (Mohr-Coulomb analysis).
Active and passive state of stresses (Rankine analysis).
Criteria of storage design for flow (Jenike analysis).

Evaluation:
Attendance is required for at least 2/3 of the lecture hours.
Final evaluation will be based on an oral examination.
Reactive Fluid Mechanics

Lecturers:
Prof. Paolo Canu, Dipartimento di Ingengeria Industriale, University of Padova, paolo.canu@unipd.it

Topics:
Review of the essential of non-reactive, isothermal, incompressible flow field computation and coupled effects.
The prediction of temperature distribution in convective, unreactive flows. The variable density case, including buoyancy (subsonic flows). Mixing.
Homogeneous and heterogeneous reactions: concepts, examples, implementation, effects.
The specific case of porous materials.

Language: English

Evaluation:
Attendance is required for all the course.
The final evaluation is based on the oral discussion of one of the case studies developed during the course or independently by the student, on a specific application of his/her interest
Research and Entrepreunership: from scientific papers and IP to startup creation

Lecturers:
Prof. Fabrizio Dughiero, DII, University of Padova, fabrizio.dughiero@unipd.it

Topics:
The course aims to develop PhD candidates' ability to transform an idea, linked to a patent owned by our University, into a business model for a technological startup. Intellectual property protection mechanisms, rights of university employees, private employees and freelancers. What is a startup, a spin-off and laws and regulations that govern its constitution and development. Funding sources. Intellectual property analysis proposed by the teacher and choice of patents on which to develop the team work. Choice of the patent to be developed. Analysis of the technology, idea or business model underlying the patent. Setting up the analysis work using «design thinking» techniques. First report about planning of the work to be done. Market and competition analysis. Introduction to the Business Model Canvas and compilation of the main parts of the Canvas. Preparation of a concise and effective draft business plan. Preparation of the pitch to be presented to investors. Presentation session to other teams of the project work and discussion about strengths and weaknesses of business idea.

Evaluation:
Attendance is required for at least 2/3 of the lecture hours. Final evaluation will be based on the discussion of a case study related to the individual or team project.
Doctoral Program in Industrial Engineering  
Course plan 39th cohort

Smart Technologies for the sustainability of the food chain

Lecturers:
Ing. Silvia Minetto, Istituto per le Tecnologie della Costruzione, Consiglio Nazionale delle Ricerche-Padova CNR-ITC, silvia.minetto@itc.cnr.it
Ing. Antonio Rossetti, Istituto per le Tecnologie della Costruzione, Consiglio Nazionale delle Ricerche-Padova CNR-ITC, antonio.rossetti@itc.cnr.it

Topics:
General aspects of technologies for the sustainability of the food chain: integration, interaction and optimisation of energy flows within and between food chain sectors, use of natural fluids, energy efficiency and improved preservation conditions.
Refrigeration systems and heat pumps working with natural refrigerants.
State-of-the-art technologies in commercial refrigeration and in transport refrigeration and last mile delivery.
Field monitoring, control and management. Field data processing.
Experience with a CO2 unit for transport refrigeration at thermal-fluid dynamic lab at CNR-ITC.

Duration: 16 hours (4 credits)

Academic years: 2024/25

Language: English

Evaluation:
Attendance is required for at least 2/3 of the lecture hours.
Final evaluation will be based on processing and analysis of lab/field data from a food chain system.
**Statistics for Engineers**

**Lecturers:**
Prof. Luigi Salmaso, Department of Management and Engineering, University of Padova, luigi.salmaso@unipd.it
Prof. Rosa Arboretti, Department of Civil, Environmental and Architectural Engineering, University of Padova, rosa.arboretti@unipd.it
Prof. Marta Disegna, Department of Management and Engineering, University of Padova, marta.disegna@unipd.it

**Topics:**
In this course will be offered an introduction to statistical methods most frequently used for experimentation in Engineering.
The course aims to develop knowledge of the fundamental statistical processes, techniques and ideas used in the collection, presentation, analysis and interpretation of data. develop the ability to understand, interpret, and communicate quantitative results and show how quantitative methods may be used to provide reliable information. develop an understanding of the scope and limitations of quantitative analysis.
The indicative content of the course is as follows: elements of univariate statistical methods, including descriptive statistics, probability and inferential statistics (point estimate, confidence interval and hypothesis tests). linear and non-linear regression models. multivariate data analysis. Design of experiment.
Lectures will cover both theoretical aspects and the analysis of practical problems. The applications will be conducted using MINITAB, licensed to University of Padova, and R/ Rstudio, open-source software.

Stochastic methods for single- and multi-objective optimization

Lecturers:
Ing. Riccardo Torchio, DII, University of Padova

Topics:
- Particle Swarm Optimization (PSO):
  Objectives of the lecture, Origins, Basics, Terminology, Implementation (Matlab code), Numerical experiments, The missing details, Conclusions
- Differential Evolution (DE)
  Objectives of the lecture, Historical notes, Basics, Implementation (Matlab code), Improvement strategies, Constraint handling, Conclusions
- Surrogate Modelling
  Objectives of the lecture, Rationale, Surrogate modeling, 1D problem, Radial basis functions (RBFs), A successive zooming algorithm, Conclusions
- Multiobjective Optimization
  Objectives of the lecture, Multiobjective optimization, Eating out as an engineering problem, Objective weighting, Fuzzy optimization, Pareto optimization, A more general framework, Front characteristics, General (abstract) algorithm, Conclusions
- From Single-objective to Multi-objective
  Objectives of the lecture, Multiobjective optimization, MO-PSO (Naive implementation, Archive, Nondominated sorting), MO-DE (Naive implementation, Nondominated sorting, Archive) Conclusions

Attendance is required for at least 2/3 of the lecture hours. Final evaluation will be based on a small project.
Sustainable Energy in Buildings

Lecturers:
Prof. Michele De Carli, DII, University of Padova, michele.decarli@unipd.it
Dr. Laura Carnieletto, DII, University of Padova, laura.carnieletto@unipd.it
Dr. Giuseppe Emmi, Università di Ferrara, giuseppe.emmi@unife.it
Dr. Jacopo Vivian, DII, University of Padova, jacopo.vivian@unipd.it

Topics:
Efforts to reduce CO2 emissions have become a pivotal environmental priority of this century. Buildings are responsible for about 40% of total energy consumption in Europe and similar values are also found in other countries. To decrease this value some of the open options are those of improving the quality of buildings’ envelopes or of using energy-efficient heating and cooling technologies based on renewable energies. The current tendency when new constructions are being designed is to plan low or nearly zero energy buildings. The course looks at the assessment of current and potential future energy systems in buildings, covering conversion, and end-use, with emphasis on meeting regional and global energy needs in a sustainable manner. Different renewable and conventional energy technologies will be presented and their attributes described within a framework that aids in evaluation and analysis of energy technology systems in the context of environmental goals. During the course modelling approaches, methods, simulation tools and instruments to evaluate the energy performance of buildings and indoor environmental quality will be also presented and used. During the course, the CoreCare Laboratory to evaluate the thermal comfort and indoor environmental quality will be also presented.

Attendance is required for at least 2/3 of the lecture hours.
Final evaluation will be based on a written questionnaire.
Technological Advancements in Electromobility

Lecturers:
Prof. Manuele Bertoluzzo, DII, University of Padova, manuele.bertoluzzo@unipd.it.
Prof. Giuseppe Buja, DII, University of Padova, giuseppe.buja@unipd.it

Topics:
The course is divided into four 2-hour lessons. The first lesson deals with the different architectures of the powertrain of the purely electric and hybrid vehicles. The second lesson deals with the energy storage devices (batteries and supercapacitors) on-board the electric vehicles. The third lesson deals with the infrastructures for the wired charging of the batteries of the electric vehicles and introduces the relevant classification. The fourth lesson addresses the working principles of the wireless charging of the electric vehicles considering both the static and the dynamic implementations.

Language: English

Evaluation:
Attendance is required for at least 2/3 of the lecture hours.
Final evaluation will be based on a colloquium.
Technologies for boosting energy efficiency and spreading renewable plants

Lecturers:
Prof. Alberto Benato, DII, University of Padova, alberto.benato@unipd.it
Prof.ssa Anna Stoppato, DII, University of Padova, anna.stoppato@unipd.it
Prof.ssa Giovanna Cavazzini, DII, University of Padova, giovanna.cavazzini@unipd.it

Topics:
To move towards a sustainable power generation system, there is a need to properly use the energy produced by renewable energy plants as well as to better exploit each source of waste heat. To do that, the point is to have access to energy storage technologies and waste heat recovery units as well as to be able to integrate them into more complex energy systems.

The idea is to build up hybrid energy systems in which renewable- and fossil-based plants, energy storage systems and waste heat recovery units work in synergy to supply electricity, heat, cold, water and fuels (e.g., hydrogen, biogas, bio-methane, etc.) in the most effective mode.

In this context, the first aim of the COURSE is to present and classify the energy storage technologies and the waste heat recovery units as well as to define the hybrid system concept and working principle. After that, the attention will be paid on the design of the storage technologies and of the waste heat recovery units.

In particular, for the storage units, the focus will be on the mechanical and thermal energy storage technologies and will consider the thermodynamic cycles, the up-to-date ways of construction and the economic aspects. In this way, the technologies will not be analyzed only as a black-box storage devices, but considering, e.g., the thermodynamic cycles itself allowing the conversion of electricity into heat during the charging phase and the conversion of heat into electricity during the discharge process. In addition to that and based on the grid or renewable plant’s needs, different reference cycles and configurations will be presented as well as their control strategies.

In a similar way, the waste heat recovery units will be presented taking into account the thermodynamic, the economic and the technical point of views.

After the technologies overview, they will be compared based on technical, economic, and environmental indexes.

Finally, being storage and waste heat technologies fundamental to boost energy efficiency and spreading renewable plants, the benefits of inserting all of them in a unique hybrid system will be presented in conjunction with optimization techniques able to take into account not only the requested fluxes (electricity, heat, cold, etc.) but also the specific features of each technology. In this manner, the most suitable hybrid system configuration can be designed.

Tutela della proprietà intellettuale

Lecturers:
Avv. Luca Giove - Libero professionista
Personale interno - Settore Trasferimento di tecnologia, Ufficio valorizzazione della ricerca, University of Padova

Topics:
1. La tutela dell’innovazione tecnologica: brevetti, modelli di utilità, altre privative e segreto industriale (Avv. Luca Giove)
2. Aspetti tecnici dei brevetti nel settore ingegneristico (Ing. Gianluigi Zanettin)
   - Introduzione generale alla tutela della Proprietà Intellettuale
   - Funzione e struttura del brevetto d’invenzione
   - Esclusioni dalla brevettabilità: cenni alla brevettazione del software
   - I requisiti di brevettabilità
   - I diritti conferiti dal brevetto
   - La valutazione dell’interferenza con diritti brevettuali di terzi
   - Tutelabilità vs attuabilità, brevettabilità vs interferenza
   - Esempi
   - Le ricerche di anteriorità
3. I servizi dell’Ateneo ai dottorandi e ricercatori nel campo della proprietà intellettuale
   (Personale interno - Ufficio valorizzazione della ricerca, University of Padova)

Vibration energy harvesting

Lecturers:
Prof. Alberto Doria, DII, University of Padova, alberto.doria@unipd.it

Topics:
Review on mechanical vibrations.
Fundamentals of vibration harvesting technologies, piezoelectric, electromagnetic and capacitive harvesters.
Solution of the equations of motion with the modal superposition approach.
Harmonic analysis calculations of the frequency response functions of voltage and stress.
Testing of piezoelectric harvesters with impulsive methods and by means of shakers
Applications of harvesters
Applications of piezoelectric harvesters (harvesters for vehicles, rain-drop harvesters)
